one of the most intriguing questions in image processing is the problem of recovering the desired or perfect image from a degraded version in many instances one has the feeling that the degradations in the image are such that relevant information is close

to being recognizable if only the image could be sharpened just a little this monograph discusses the two essential steps by which this can be achieved namely the topics of image identification and restoration more specifically the goal of image identification is to estimate the properties of the imperfect imaging system blur from the observed degraded image together with some statistical characteristics of the noise and the original uncorrupted image on the basis of these properties the image restoration process computes an estimate of the original image although there are many textbooks addressing the image identification and restoration problem in a general image processing setting there are hardly any texts which give an indepth treatment of the state of the art in this field this monograph discusses iterative procedures for identifying and restoring images which have been degraded by a linear spatially invariant blur and additive white observation noise as opposed to non iterative methods iterative schemes are able to solve the image restoration problem when formulated as a constrained and spatially variant optimization problem in this way restoration results can be obtained which outperform the best results of conventional restoration filters

advocacy of the rasch model in australia happy 80th birthday john xii there are good introductory texts on item response theory objective measurement and the rasch model however for a beginning researcher keen on utilising the potentials of the rasch model theoretical discussions of test theory and associated indices do not meet their pragmatic needs furthermore many researchers in measurement still have little or no knowledge of the features of the rasch model and its use in a variety of situations and disciplines this book attempts to describe the underlying axioms of test theory and in particular the concepts of objective measurement and the rasch model and then link theory to practice we have been introduced to the various models of test theory during our graduate days it was time for us to share with those keen in the field of measurement in education psychology and the social sciences the theoretical and practical aspects of objective measurement
